

Form A - Notice of Intent to Bid

Date: November 22,2006

Our organization intends to submit a proposal in response to the Delmarva Power & Light Request for Proposals for Generation Capacity and Power Purchase Agreement:

e-mail: peter@bluewaterwind.com

Alternate Contact Name: Robert Propes

Address: One Innovation Way

Suite 304F

Newark, DE 19711

Phone: 302-731-7020

e-mail: robert@bluewaterwind.com

Project Description:

(include technology type, incremental facility capacity (MW), expected capacity factor and interconnection point (PJM bus #))

The proposed Bluewater Wind Atlantic North Site will consist of 200, 3.0 MW wind powered generators having a total installed site capacity of 600 MW. PJM will assign an initial capacity rating of 120 MW to this project which is approximately 20 percent of the total installed capacity. The 120 MW capacity rating is projected to increase to 180 MW in accordance with PJM rules as the performance of this project is documented over a three-year period.

The electric output of the individual wind powered generators will be connected to one of two 34.5/138 KV substations located at the generation site. Each of these substations will be connected to the PJM transmission system by a single 138 KV circuit. For the purpose of this Notice of Intent, the proposed interconnection point for the two 138 KV circuits from the North Ocean generation site is the 138 KV bus (PJM Bus No. 9178) at Delmarva Power's Rehoboth Substation.

Provided a suitable location for a 138 KV switching station can be found between Indian River Inlet and Rehoboth, Bluewater Wind proposes the following alternate for consideration by Delmarva Power to facilitate connection to the Delmarva Power

transmission system: Convert the existing 69 KV transmission line between the Bethany Substation and the Rehoboth Substation to 138 KV and convert the Delmarva Power Cedar Neck Substation to 138 KV. Bluewater Wind would propose to construct a new 138 KV switching station to facilitate the connection of the two 138 KV circuits from the generation site to the converted 138 KV line between Bethany Substation and Rehoboth Substation. The proposed new switching station would be located outside of the dense residential area of Rehoboth. The following benefits would be realized by the proposed alternative:

- a. Greatly reduce the impacts of transmission line construction on the Rehoboth area residents.
- b. Greatly improve Delmarva Power's transmission system reliability in the Rehoboth/Bethany area.
- c. Improve Delmarva Power's load transfer capability between Rehoboth and Bethany.
